```

ARIMA Model

To predict time series with ARIMA, we need to set the values of three parameters (p,d,q):

p: The order of the auto-regressive (AR) model (i.e., the number of lag observations)

d: The degree of differencing.

q: The order of the moving average (MA) model.

Checking if data is stationary - We can see that it is not based on the P-value - Augmented Dickey Fuller Test

In [20]:

```
from statsmodels.tsa.stattools import adfuller
results = adfuller(train_time_series['Ottawa Gas Price Train'])
print('ADF Statistic: ', results[0])
print('p-value: ', results[1])
print('Critical Values', results[4])
```

ADF Statistic: -1.5808843641015518

p-value: 0.49318840715782136

Critical Values {'1%': -3.4309479372130327, '5%': -2.8618042551778133, '10%': -2.5669106579017864}

Taking First difference - P value is < 0.05. We can stop at the First Difference; d = 1

In [21]:

```
train_time_series_stationary1 = train_time_series.diff().dropna()
results1 = adfuller(train_time_series_stationary1['Ottawa Gas Price Train'])
print('ADF Statistic: ', results1[0])
print('p-value: ', results1[1])
print('Critical Values', results1[4])
```

ADF Statistic: -29.43882745325999

p-value: 0.0

Critical Values {'1%': -3.4309479372130327, '5%': -2.8618042551778133, '10%': -2.5669106579017864}

The Order of Autoregressive Term p; p = 0

In [22]:

```
plt.rcParams.update({'figure.figsize':(12,3), 'figure.dpi':120})
from statsmodels.graphics.tsaplots import plot_pacf
plot_pacf(train_time_series_stationary1, lags=10, title="Partial Autocorrelation 1st Order")
plt.xlabel('Lag')
plt.ylabel('PACF')
plt.show()
```

The order of the Moving Average term q ; $q = 0$

```
In [23]: plt.rcParams.update({'figure.figsize':(12,3), 'figure.dpi':120})
from statsmodels.graphics.tsaplots import plot_acf
plot_acf(train_time_series_stationary1, lags=20, title="Autocorrelation 1st Order Differencing")
plt.xlabel('Lag')
plt.ylabel('ACF')
plt.show()
```

Check the above p, d, q parameters with Auto Arima - Best Model ARIMA (0,1,0)

```
In [24]: import pmdarima as pm
from pmdarima.model_selection import train_test_split
import numpy as np

modell = pm.auto_arima(train_time_series, trace=True, error_action='ignore', suppress_warnings=True)
modell.fit(train_time_series)

forecast1 = modell.predict(n_periods=len(test_time_series))
forecast1 = pd.DataFrame(forecast1, index = test_time_series.index, columns=['Prediction'])
```

Performing stepwise search to minimize aic
