```

ARIMA Model

To predict time series with ARIMA, we need to set the values of three parameters (p,d,q):

p: The order of the auto-regressive (AR) model (i.e., the number of lag observations)

d: The degree of differencing.

q: The order of the moving average (MA) model.

Checking if data is stationary - We can see that it is not based on the P-value - Augmented Dickey Fuller Test

In [20]:

```
from statsmodels.tsa.stattools import adfuller
results = adfuller(train_time_series['Timmins Diesel Price Train'])
print('ADF Statistic: ',results[0])
print('p-value: ',results[1])
print('Critical Values', results[4])
```

```
ADF Statistic:  -0.948166359384132
p-value:  0.7716972106846214
Critical Values {'1%': -3.430947118228067, '5%': -2.8618038932681364, '10%': -2.5669104652
579886}
```

Taking First difference - P value is < 0.05. We can stop at the First Difference; d = 1

In [21]:

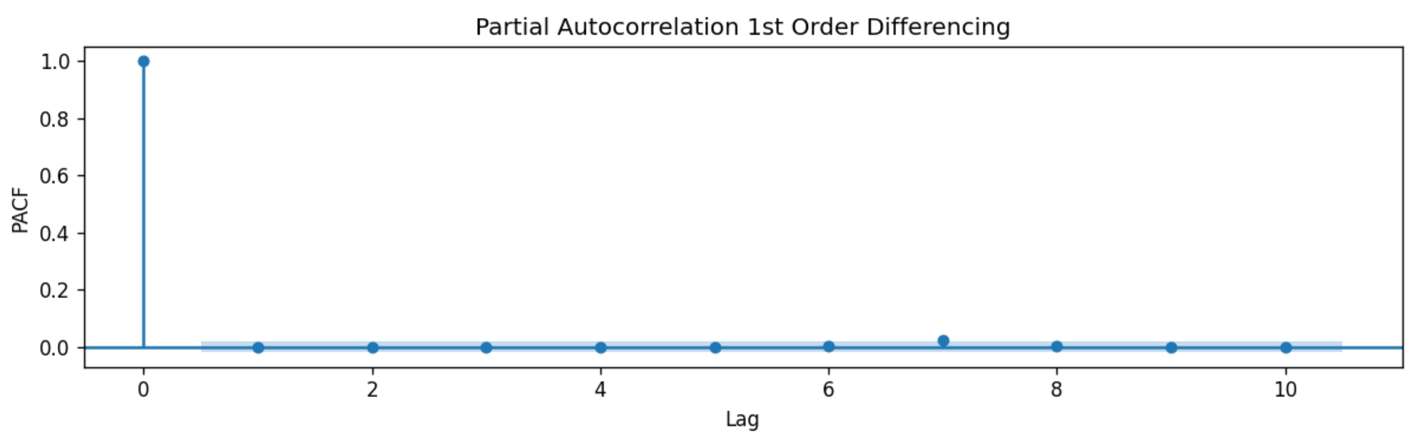
```
train_time_series_stationary1 = train_time_series.diff().dropna()
results1 = adfuller(train_time_series_stationary1['Timmins Diesel Price Train'])
print('ADF Statistic: ',results1[0])
print('p-value: ',results1[1])
print('Critical Values', results1[4])
```

```
ADF Statistic:  -104.65013792293605
p-value:  0.0
Critical Values {'1%': -3.4309471727572607, '5%': -2.861803917364605, '10%': -2.5669104780
8449}
```

The Order of Autoregressive Term p; p = 0

In [22]:

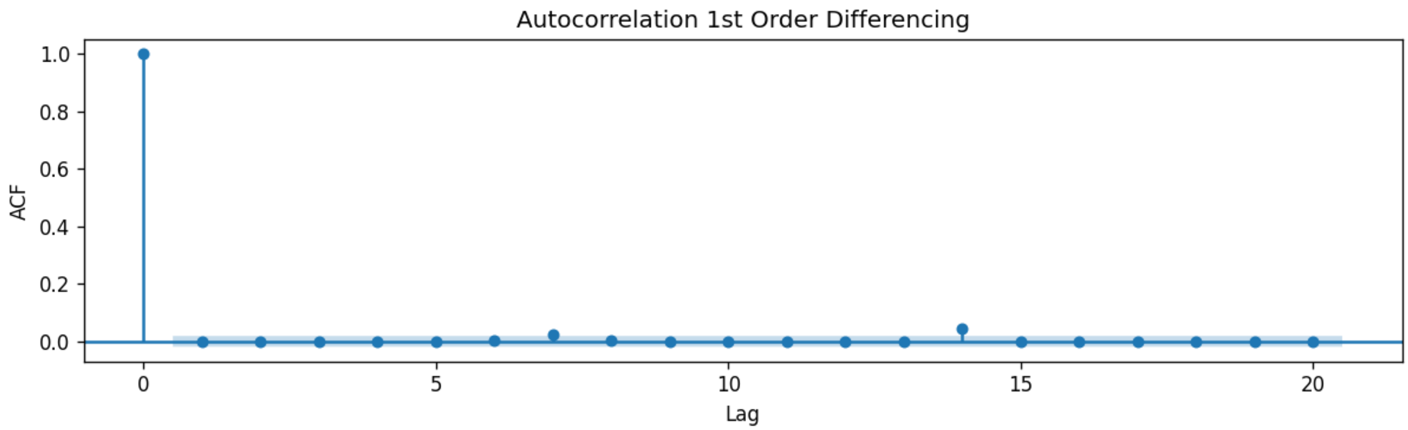
```
plt.rcParams.update({'figure.figsize':(12,3), 'figure.dpi':120})
from statsmodels.graphics.tsaplots import plot_pacf
plot_pacf(train_time_series_stationary1, lags=10,  title="Partial Autocorrelation 1st Orde
plt.xlabel('Lag')
plt.ylabel('PACF')
plt.show()
```



The order of the Moving Average term q; q = 0

In [23]:

```
plt.rcParams.update({'figure.figsize':(12,3), 'figure.dpi':120})
from statsmodels.graphics.tsaplots import plot_acf
plot_acf(train_time_series_stationary1, lags=20,  title="Autocorrelation 1st Order Differe
plt.xlabel('Lag')
plt.ylabel('ACF')
plt.show()
```



Check the above p,d,q parameters with Auto Arima - Best Model ARIMA (0,1,0)

In [24]:

```
import pmdarima as pm
from pmdarima.model_selection import train_test_split
import numpy as np

model1 = pm.auto_arima(train_time_series, trace=True, error_action='ignore', suppress_warn
model1.fit(train_time_series)

forecast1 = model1.predict(n_periods=len(test_time_series))
forecast1 = pd.DataFrame(forecast1,index = test_time_series.index,columns=['Prediction'])
```

```
Performing stepwise search to minimize aic
 ARIMA(2,1,2)(0,0,0)[0] intercept   : AIC=38225.382, Time=1.52 sec

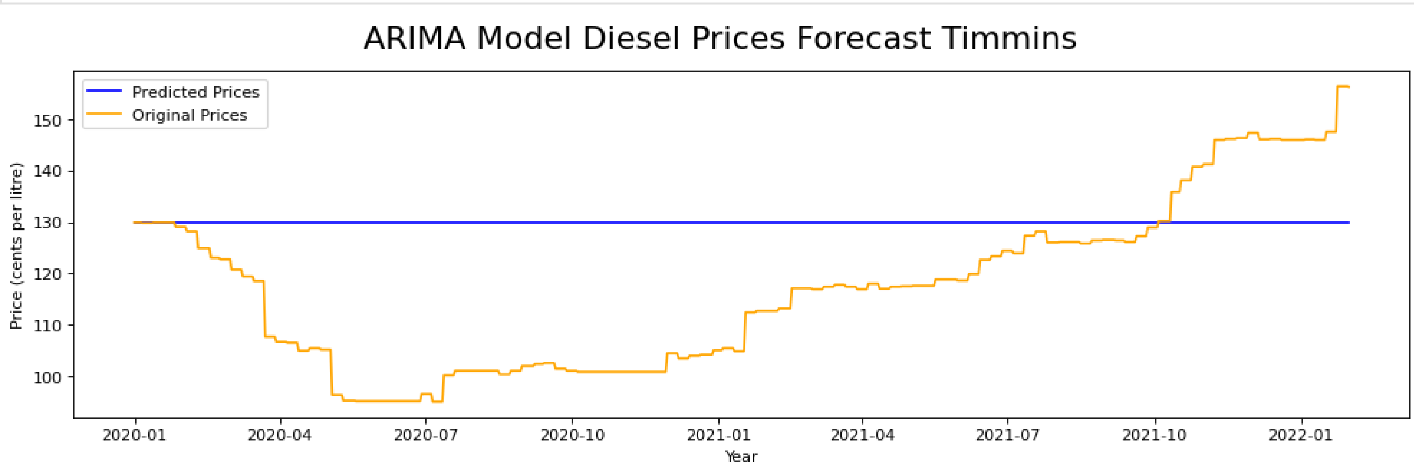
plt.legend(loc='best')
plt.suptitle('ARIMA Model Diesel Prices Forecast Timmins', fontsize=20)
plt.xlabel('Year')
plt.ylabel('Price (cents per litre)')
plt.show()
```



Evaluation of the Model

Mean Absolute Error (MAE) ARIMA

In [29]:
```
from sklearn.metrics import mean_absolute_error
maeARIMA=mean_absolute_error(test_time_series['Timmins Diesel Price Test'],ARIMA_Predict)
print('Mean Absolute Error ARIMA = {}'.format(round(maeARIMA, 2)))
```

```
Mean Absolute Error ARIMA = 17.25
```

Mean squared error (MSE) ARIMA

In [30]:
```
from sklearn.metrics import mean_squared_error
mseARIMA=mean_squared_error(test_time_series['Timmins Diesel Price Test'],ARIMA_Predict)
print('The Mean Squared Error ARIMA = {}'.format(round(mseARIMA, 2)))
```

```
The Mean Squared Error ARIMA = 412.19
```

Root mean squared error (RMSE) ARIMA

In [31]:
```
from numpy import sqrt
rmseARIMA = sqrt(mseARIMA)
print('The Root Mean Squared Error ARIMA = {}'.format(round(rmseARIMA, 2)))
```

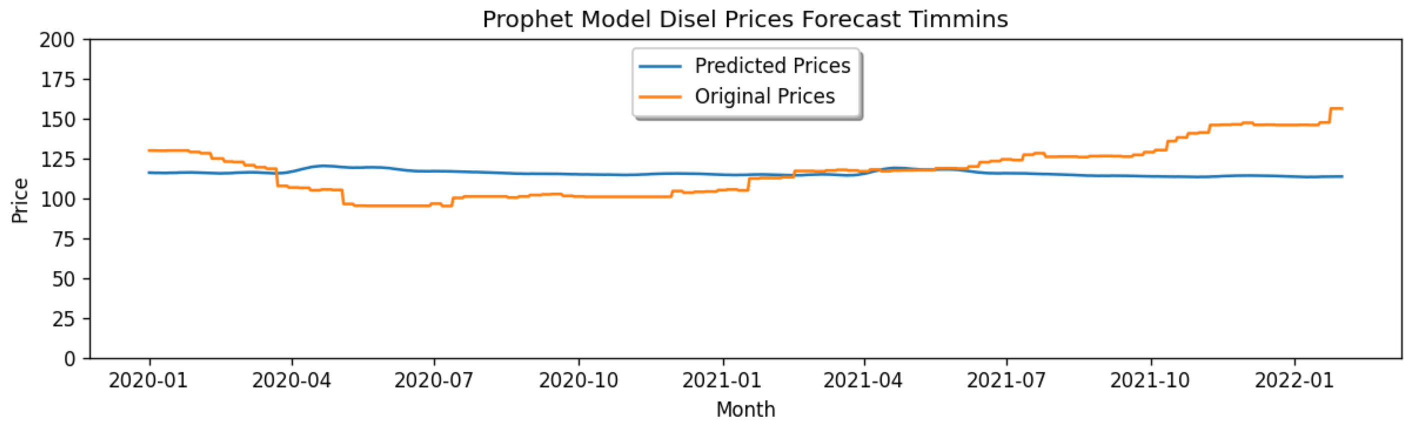
```
The Root Mean Squared Error ARIMA = 20.3
```

Prophet Model

In [32]:
```
from fbprophet import Prophet
d={'ds':train['Date'],'y':train['Timmins']}
df_pred=pd.DataFrame(data=d)
model_prophet = Prophet(daily_seasonality=False)
model_prophet_result = model_prophet.fit(df_pred)
```

In [33]:
```
future = model_prophet.make_future_dataframe(periods=765)
forecast = model_prophet.predict(future)
forecast = forecast[(forecast['ds' ] >= '2020-01-01') & (forecast['ds' ] <= '2022-01-31')]
```

In [34]:
```
fig, ax = plt.subplots()
ax.plot(forecast['ds'], forecast['yhat'], label='Predicted Prices')
ax.plot(test['Date'], test['Timmins'], label='Original Prices')
plt.ylim([0,200])
legend = ax.legend(loc='upper center', shadow=True)
plt.title('Prophet Model Disel Prices Forecast Timmins')
plt.xlabel('Month')
plt.ylabel('Price')
plt.show()
```



Mean Absolute Error (MAE) Prophet

In [35]:

```
maeProphet=mean_absolute_error(test['Timmins'],forecast['yhat'])
print('Mean Absolute Error Prophet = {}'.format(round(maeProphet, 2)))
```

```
Mean Absolute Error Prophet = 13.87
```

Mean squared error (MSE) Prophet

In [36]:

```
mseProphet = mean_squared_error(test['Timmins'],forecast['yhat'])
print('The Mean Squared Error Prophet =  {}'.format(round(mseProphet, 2)))
```

```
The Mean Squared Error Prophet =  284.28
```

Root mean squared error (RMSE) Prophet

In [37]:

```
rmseProphet = sqrt(mseProphet)
print('The Root Mean Squared Error Prophet = {}'.format(round(rmseProphet, 2)))
```

```
The Root Mean Squared Error Prophet = 16.86
```
